25) Handle Missing Values in a Dataset

Write a Scala program to handle missing values in a dataset. Replace all missing (`null`) values with the **mean of the available values in the column**.

Code:

```
object Scala25 extends App {  
  
    val sales: List[java.lang.Double] =  
        List(100.0, 200.0, null, 300.0, null)  
  
    // Remove null values  
    val v = sales.filter(_ != null)  
  
    // Calculate mean  
    val mean = v.map(_.toDouble).sum / v.length  
  
    println("Mean Sales: " + mean)  
  
    // Replace null values with mean  
    val n = sales.map { value =>  
        if (value == null) mean  
        else value  
    }  
  
    println("Original Data:")  
    println(sales.mkString(", "))  
  
    println("After Replacing Missing Values:")  
    println(n.mkString(", "))  
}
```

Output:L

```
Mean Sales: 200.0
Original Data:
100.0, 200.0, null, 300.0, null
After Replacing Missing Values:
100.0, 200.0, 200.0, 300.0, 200.0

Process finished with exit code 0
|
```
